HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

In Claim 3, Line 1: Deleted "The body fluid shunt of claim 2," replaced with
-----The body fluid shunt of claim 1-----

REASONS FOR ALLOWANCE

Claims 1, 3-6, 8, 10-16, 18-21, 73-75, 78-80, and 84-107 are allowed. The following is an examiner's statement of reasons for allowance:

Regarding Claims 1 and 73-75, the instant claims are drawn to a fluid shunt valve comprising an inlet port, an outlet port, and a valve portion situated therebetween. The valve defines a piston face that bears against a deformable diaphragm, such that the piston is displaceable to actuate the valve. Specifically, the piston has a cutout defined therein, such that the cutout is alignable with the drain port of the valve only when the piston is displaced. The piston is **rotationally displaceable**, such that the cutout **moves along a curved path to align with the drain port when the piston is displaced**. See Figure 3 of the instant application. The prior art does not teach or

suggest a downstream-pressure-independent flow valve that has a cutout piston with a rotary axis of rotation.

The closest prior art of record is Rubenstein (US 7,025,742), which teaches a shunt valve that regulates fluid flow from an inlet to an outlet based on fluid pressure. Specifically, the valve comprises piston 196 that moves relative to a cutout 190 in the wall of the valve (see Figures 16-18). Rubenstein, however, does not teach that the cutout is formed as part of the piston. *Additionally, Rubenstein does not teach or suggest that the piston is curved and rotationally displaceable upon changes in fluid pressure.*

In the arguments filed 7/13/10, applicant argued that it would not have been obvious to one of ordinary skill in the art to modify Rubenstein's valve with the rotationally-displaced fluid valve of Zinger (US 6,379,340) because Zinger's valve is not automatically pressure-regulated by a diaphragm. This argument has been found persuasive. It is the examiner's position that one of ordinary skill in the art would not have thought to modify Rubenstein's valve with a rotating piston and cutout because Rubenstein's device is dependent on axial fluid pressure that bears downward on a spring 200 to move the piston. The use of a rotating valve would substantially destroy the functionality of Rubenstein's device.

Regarding Claim 8, the instant claim is drawn to a fluid shunt valve comprising an inlet port, an outlet port, and a valve portion situated therebetween. The valve defines a piston face that bears against a deformable diaphragm, such that the piston is

displaceable to actuate the valve. Specifically, the piston comprises a piston face defined on the upstream side thereof, at least a portion of the piston face being defined by a deformable diaphragm, *a deformable mask thereon, the mask deforming to bear against the drain port in accordance with any pressure differential across the piston*, and a cutout defined within the deformable mask, the cutout being alignable with the drain port when the piston is displaced.

Rubenstein's cutout valve is not designed to completely close the flow path, but rather to control a non-zero rate at which fluid flows. *Further, the prior art neither teaches nor suggests the use of a mask that is substantially flexible, such that the fluid pressure creates a seal as the piston presses against said mask.* Rubenstein's piston is limited to bidirectional motion, and does not comprise a flexible member against which the piston presses. Furthermore, because the purpose of Rubenstein's device is not to stop fluid flow at a given time, there is no motivation to modify Rubenstein's device with a flexible mask that creates a fluid-tight seal. Doing so would destroy the functionality of Rubenstein's device because fluid flow could potentially be stopped at certain piston positions.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
